

# Connected & Autonomous Vehicles – The future of Mobility and the implications for insurance

**@AXADavidW**

**David Williams, Managing Director, Underwriting & Technical Services  
AXA Insurance UK**

# CII Lecture - Driverless Cars

## Learning Objectives - What will we cover today?

At the end of this event, you will:

- Have gained an understanding of some of the Government backed consortia and why AXA & other insurers are involved in these
- Seen how the UK Insurance industry is responding and the workings of the ABI ADIG
- Understand details of the governments work with regard to making **Connected & Autonomous Vehicles** (CAV's) a reality for the UK
- Be aware of Possible Timelines for the various stages of Driver assistance systems moving through to fully autonomous driving
- Have discussed possible impacts of CAV's on the current insurance market, including changes to Motor and Public/Products Liability
- Have considered the implications of the Uber Crash
- Have heard about other recent developments!

# Connected & Autonomous Vehicles (CAV's)

## THE CONNECTED CAR

## “DRIVERLESS CARS”

**100%** Of cars will be connected by 2025<sup>1</sup>

**75%** Of cars on the road will be autonomous by 2035<sup>2</sup>

Source: <sup>1</sup>GSMA 2013, <sup>2</sup>Navant Research 2013

- Autonomous Technology
- Motor Manufacturers (OEM's)
- Mobility as a Service / Sharing Society

# Why are Insurers Involved?

**35 Million Vehicles**

licensed on the road

This figure has increased every year since the end of the Second World War (except 1991)

**90%**

of all accidents are caused by driver error

**1,700+**

people died in vehicle collisions in the UK in 2013

**Road traffic injuries are the leading cause of death among young people, aged 15–29 years**

**2,500**

lives saved in the UK by 2030

**£2,767**

average cost claimed for car insurance

**£11,292**

average cost claimed for bodily injury

**£16bn**

annual cost to GB economy

**46%**

17-30 year olds do not hold a full driving licence

Vehicle Technologies and looking at integrating vehicles into urban environments

1. To develop an understanding and articulation of user needs and expectations of CAVs in order to maximise the mobility potential they pose.
2. To develop usable adaptive interfaces, performance certification processes and products and services that enable secure, trustworthy and private technology within CAVs.
3. To capture the data created by CAVs to develop innovative new tools and products.
4. To leverage existing investment to expand validation and test capabilities in both urban and interurban networked environments and enhance the commercial opportunities this will deliver.

# #PodOnTour!

# CAPRI - Connected & Autonomous POD on-Road Implementation

***Project will trial POD mobility service at Queen Elizabeth Olympic Park***

***Pilot could pave the way for the use of autonomous and connected vehicles in airports, hospitals, business parks and shopping centres***

## About CAPRI

CAPRI (Connected & Autonomous POD on-Road Implementation) is a large consortium comprising 20 partnering organisations.

With a strong mix of academia, business and public sector authorities, each member will play an important role in the delivery of the CAPRI mobility service pilot scheme. The 20 CAPRI partners are: AECOM, AXA, Burges Salmon, Conigital, dynniq, ESP Group, Fusion Processing, Heathrow, Loughborough University, NEXOR, Queen Elizabeth Olympic Park, South Gloucestershire Council, Transport Simulation Systems, University of Warwick, University of Bristol, thingful, TVS, University of the West of England, Westfield and YTL.

# Robopilot

- ➔ Charge Automotive has won Innovate UK backing to help develop autonomous driving functionality for its new range of electric freight vehicles. Dubbed **Robopilot**, the project will see look to bring autonomous racing technology to the light commercial vehicle market.
- ➔ **Robopilot** combines input from sensors around the vehicle – such as radars, cameras, ultrasonics and lidars (light sensors to measure the distance to a target object) – with mapping, artificial intelligence and fleet information, which is then acted on by autonomous software.
- ➔ The Oxfordshire-based firm plans to bring a range of affordable, zero-emission freight trucks to the market that will be priced in line with traditional diesel counterparts.

# Consortium Project Prospectus - The 4 'T's!

## Transport

The deployment of CAV capability has considerable ramifications on the wider transport sector and cities/communities in general. Key questions that must be addressed relate to the infrastructure investment needed, the data intelligence that can be garnered for a transport operator, and how CAV is one piece of the Smart City puzzle.

## Time

CAV deployment is a question of 'when' rather than 'if'. For the UK to create a competitive advantage it is necessary to continue to invest in this area. Significant growth potential exists as well as growing global competition. The UK must maximise the opportunities that regulation currently provides and aggressively target market growth in the areas of testing and validation.

## Testing

Independent validation is fundamental to emphasise the capability and safety of any solution in the CAV space. It is vital that appropriate and audited testing takes place in a controlled environment before any deployment takes place in. As the software and hardware components come from multiple vendors and integrated numerous ways, the various levels of testing required must be fully understood and integration with primary and secondary parts must be considered. The communications backbone must be robust and secure with a realistic urban backdrop. This is necessary to fully understand real life deployment issues.

## Trust

People must believe and trust the technology they are using. They must feel safe and want to use/buy new services that CAV open up to them rather than being sold solutions that are not fit for purpose or for person. CAV must be safe, secure and valued by the consumer and understanding the behaviour and emotions around CAV is an important step towards deployment.

# TRUST?

*Percentage of consumers who feel full self-driving vehicles will not be safe*

# TRANSPORT - Integrated Solutions & Wider Implications

# Autonomous Vehicle Technology

# AUTOMATION LEVELS OF AUTONOMOUS CARS

## LEVEL 0

There are no autonomous features.

## LEVEL 1

These cars can handle one task at a time, like automatic braking.

## LEVEL 2

These cars would have at least two automated functions.

## LEVEL 3

These cars handle “dynamic driving tasks” but might still need intervention.

## LEVEL 4

These cars are officially driverless in certain environments.

## LEVEL 5

These cars can operate entirely on their own without any driver presence.

# 2018 Automation – What level have we achieved?

So where does that leave the 2018 Audi A8 AI System?

# From ADAS to Automated Driving

Lack of Clarity? = Worried insurers

SAE Level	0	1	2	3	4	5
	None	Assisted	Partial	Conditional	High	Full
Estimated Timeline	Current	Current	2016	2018	2021	2025
Control of steering, throttle, brakes	Driver	Driver & Vehicle	Vehicle	Vehicle	Vehicle	Vehicle
Monitoring of driving environment	Driver	Driver	Driver	Vehicle	Vehicle	Vehicle
Responsibility if driver fails to take control when requested	Driver	Driver	Driver	Driver	Vehicle	Vehicle
System capable in...	No capability	Some driving modes	Some driving modes	Some driving modes	Some driving modes	All driving modes

- Driver perception could be that vehicle is responsible...
- But vehicle is not responsible yet

Assisted Driving

Automated Driving

# Automated & Electric Vehicles Act

We have been involved in discussions throughout the various iterations; Modern Transport Bill / Vehicle Technology & Aviation Bill / Automated and Electric Vehicles Bill

## Automated and Electric Vehicles Bill

New rules to ensure safe and effective insurance for self-driving cars

Effective strict liability on insurers to pay out in the first instance keeping the safety of road users and pedestrians at the heart of the legislation

Realistic levels of liability on OEMs and other third parties to encourage innovation

Department for Transport

# UK Department for Transport proposal

---

## UK Government's policy aim:

- Ensure there is compulsory insurance requirement to protect victims in collisions involving a highly automated vehicle; and
- The process for the victim to make a claim is not significantly different from claims arising from conventional crashes.

## Their proposed solution:

- Don't change the civil liability regime;
- First route for the victim is via the driver/policy holder of the highly automated vehicle
- but... ***require that the owner has legal responsibility for making sure there is in place an insurance policy that includes cover for the manufacturer's and any other entities' liability.***

# How will the new system work?

- ➔ Drivers should continue to buy a single motor insurance policy to cover both manual and automated driving (drivers WON'T need to buy separate Product Liability cover).
- ➔ Insurers should have a new legal right to recovery, allowing them to get costs back from motor manufacturers, software companies or other parties in cases where the vehicle or technology was found to have been at fault.
- ➔ Strict rules on what people can and cannot do behind the wheel need to be maintained and drivers will need absolute certainty about when they can safely allow the car to drive autonomously.
- ➔ This will need to be underpinned by consistent rules on data recording and accessibility. To settle claims fairly and efficiently, insurers will need to know if the car was in automated mode and, if so, if those functions were being operated correctly.

# You can't decide who is responsible without the Data!

**Thatcham Research**  
Safer cars, fewer crashes

IS THE DRIVER LIABLE?

**WHO PAYS WHEN A DRIVERLESS CAR CRASHES?**

IS THE CAR MANUFACTURER LIABLE?

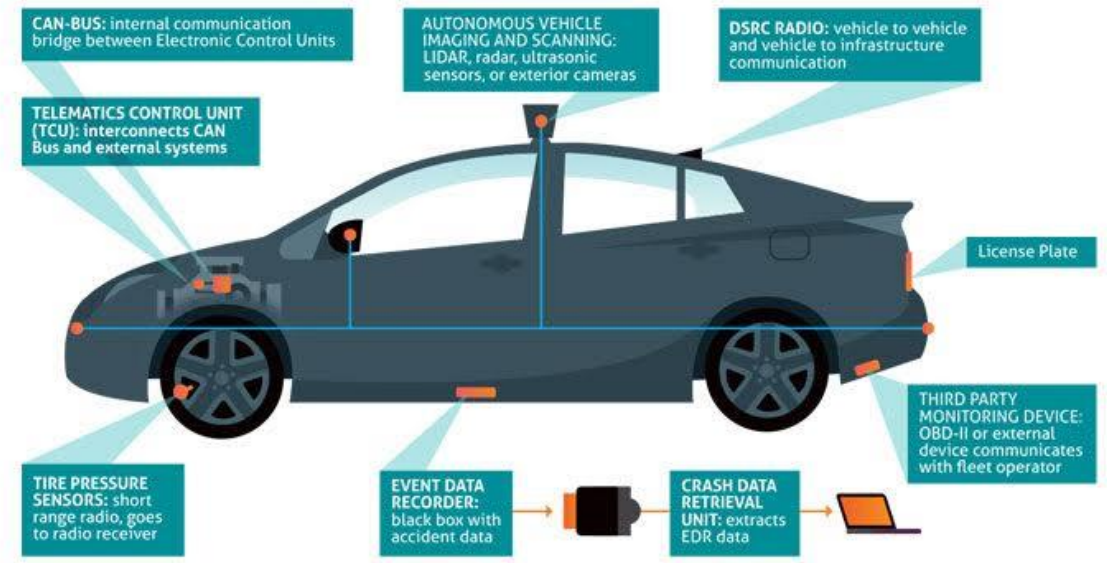

# Insurers make call for international data standards

## Access to meaningful and reliable data is a vital part of a competitive insurance market

- However ... Insurers recognise that consumers own their data and that it must be held securely
- ABI working with Thatcham and the Motor Insurers' Bureau to develop a proportionate proposal focussed on where access to data is fundamental to settling claims
- Will also seek to understand and address any barriers to data access that would hold back commercial innovation
- Regulation typically set at an international level – but ABI has emphasised to UK Government that its proposed system will not work unless it is possible to access collision data
- Important to work closely with manufacturers and recognise that there are legitimate concerns about vehicle security and protecting intellectual property.

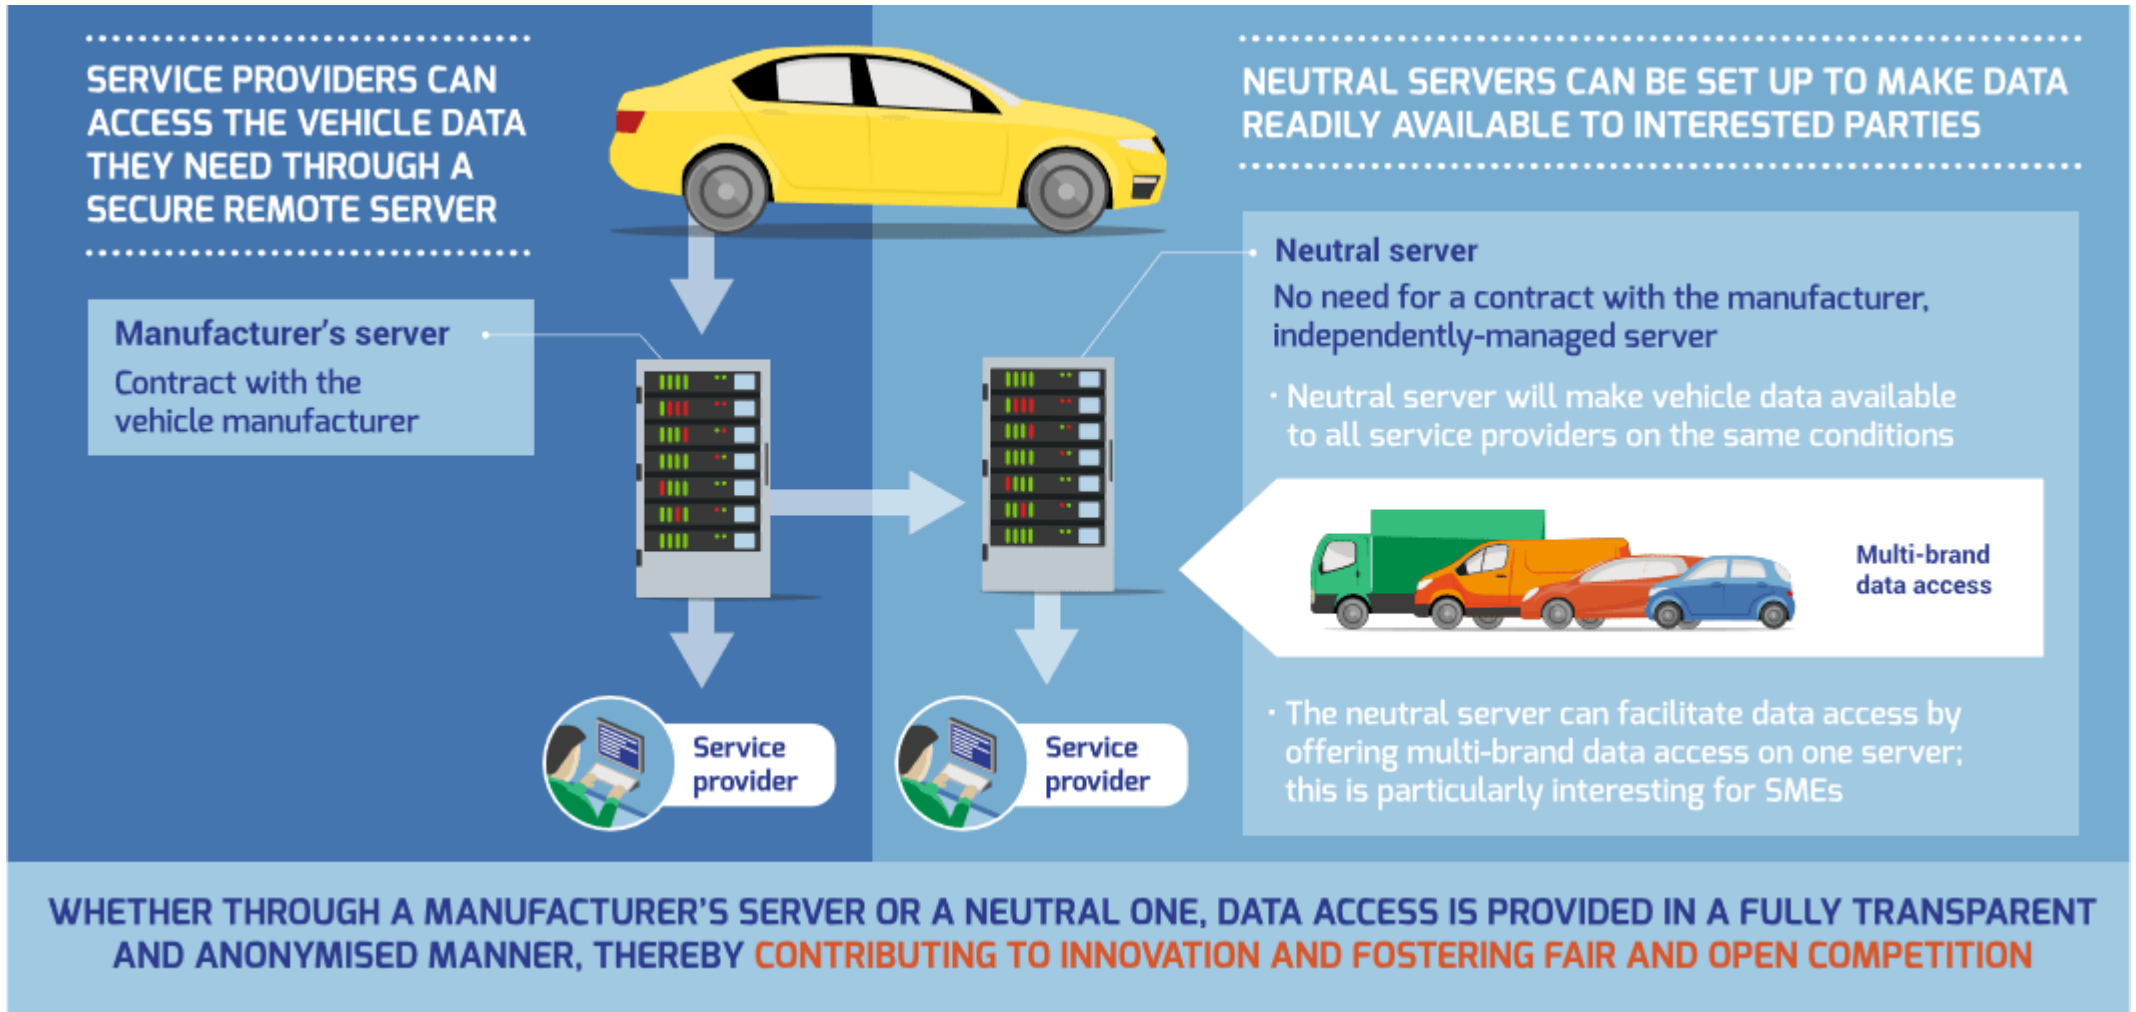

## DATA and the CONNECTED CAR

### Data Required following a Collision

- GPS record of time & location of the incident
- Was vehicle in autonomous or manual mode?
- If in autonomous mode, was vehicle parking or driving?
- When the vehicle went into autonomous mode
- When the driver last interacted with the system
- Recent driver activity (i.e. braking or steering)
- Was the driver's seat occupied?
- Was the seatbelt fastened?
